

4K  
TOTAL SYSTEM

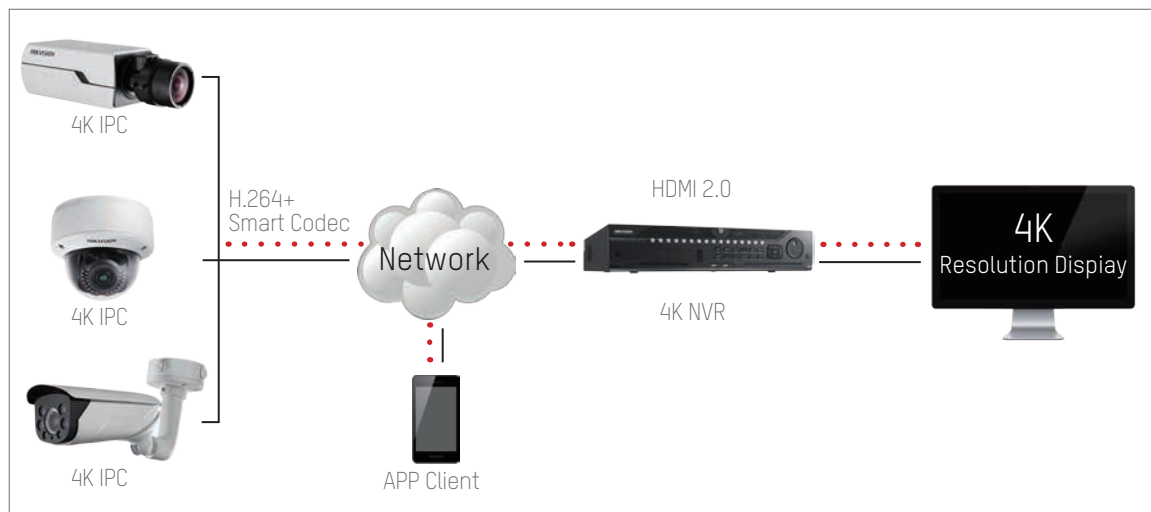

DISCOVER  
THE TRUE VALUE OF  
4K

With the development of 4K technology quickly coming into focus, opportunities to use this technology in security will continue to grow. As a leading video surveillance manufacturer, we have paid close attention to the rise of 4K and has launched a 4K total system to harness this technology in the global security industry.

Without complementary 4K components, such as monitors and NVRs, 4K cameras cannot be used to their full potential, and therefore have little practical use in surveillance. By building a total system — complete with cameras, NVRs, etc., — We strive to provide a system that is more helpful and more useful to its customers. The 4K system, which comes equipped with a variety of smart functions, satisfies the security industry's need for ultra-high resolution and smart surveillance.

## SYSTEM STRUCTURE

# KEY FEATURES

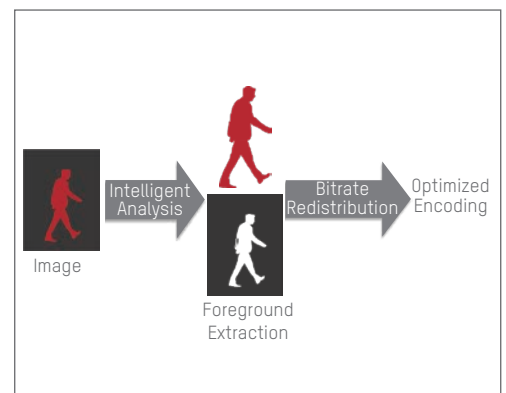

## ■ Ultra-High Definition (UHD)

The 4K system provides UHD images, which not only provides users with incredibly clear and crisp imagery, but it also results in better use of video data. Limited resolution has often hindered video analysis in the past, particularly in large scenes. Now, the increase of pixels in 4k technology has resulted in increased resolution and improved image enhancement, both of which allow for more information to be extracted. These advances elevate the accuracy and quality of content analysis to a new level while also delivering better value for users.

## ■ H.264+ Smart Codec

Our 4K systems incorporate H.264+ optimized compression, which allows users to more efficiently manage super-high-resolution video footage. With features such as background-based predictive smart encoding, enhanced noise suppression, and optimized bitrate control for long-term periods, our H.264+ compression saves bandwidth resources and decreases storage requirements.

## ■ 4K Output

The 4K NVR has an HDMI 2.0 output interface, which supports the 4K resolution output. This interface helps to form a comprehensive 4K system that includes a 4K camera input, a 4K codec, and a 4K output. Our 4K solution may be more beneficial to users than systems that are only able to provide 4K cameras or 4K codecs without the 4K output system.

## ■ Full Smart Feature-set

As a part of the Smart product family, the 4K products are equipped with smart features such as entrance management, and video analytics including region enter/exit, object left behind/object removed, and others.

## VERTICAL APPLICATION

The 4K system has applications in various vertical markets such as city surveillance, stadiums, parking lots, etc., where clear, high-resolution images and smart surveillance are necessary. With a system that includes a full suite of 4K elements versus a single 4K device, our offering is a complete solution that allows 4K technology to be implemented in a variety of vertical markets.

Parking Lot

City Surveillance

Venue Stadium
